

# ROLL WITH THE CHANGES

Go deep into database changes with a Microsoft Dynamics NAV Change Log History Management implementation from American Unit. An add-on to Microsoft Dynamics NAV, the Change Log History Management extension tracks the changes users make to the database, giving your administrators the knowledge they need to maintain database performance.

## Know the when, where and who.

Often, it's not enough to simply know that a database has been changed or what the change was. Microsoft Dynamics NAV Change Log History Management provides your systems administrators with the ability to track all user-made changes to the database. Each change is recorded along with the username of the employee who made the change and the time that the change was made.

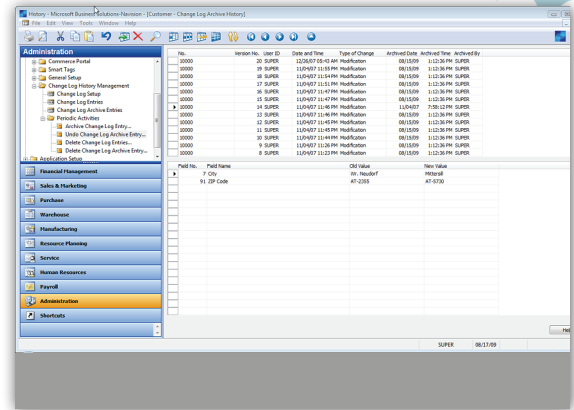

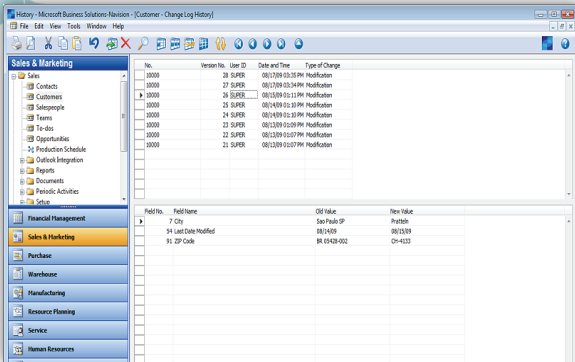

Additionally, the Change Log History Management software is version-wise, recording the version information of the database in which the change was made.

## Change Log History Management Key Benefits:

Less data redundancy, execution time and maintenance compared to standard change log functionality

Robust archiving of change log history with restore functionality

Viewing change history in table form is as simple as selecting a top-level menu item. The following sample screen shows a history view listing various versions of the customer card and the changes made by each user:

This screen shows the ability to restore past change log information.

## Features Overview

- ★ Automatic monitoring and recording of database changes
- ★ Tracking down to the user level
- ★ Time stamping
- ★ Archiving and restoration functionality
- ★ Easy-to-use interface

## Keep a history of your history.

Microsoft Dynamics NAV Change Log History Management provides the ability to archive successive versions of the change log history. The archives can be restored by simply undoing the change log archive. With Change History Log Management, your system administrators will be able to delve deep into past change histories to help troubleshoot errors, find necessary data or track down which user was responsible for a given change.
